

Panaete Angelica - FEMTO LASIK intervention in both eyes, myopia -4

After an ophthalmologic inspection, 13 years ago I discovered that I have sight problems, myopia, with a diopter of -2.75 and that I should wear glasses, news that displaced me from the start. I told the ophthalmologist that I wanted to wear the contact lenses instead of the glasses, informed me that it was okay, provided I wear glasses for 6 months, while my eyes will get used to "good viewing."

I was conscientious and wearing the glasses for 6 months, although they seemed to me unsightly and uncomfortable from all points of view. I was just waiting to pass the 6 months to wear the contact lenses, but after I went into control, the ophthalmologist told me the diopter had grown to -3.25.

The contact lenses have saved me for 12 years, wearing them almost daily, supporting them quite easily, without causing any problems or discomfort, to a point, when suddenly my eyes were revolted and could not use them and so I got back to my glasses.

After I documented on the internet about laser surgery, I got the courage being pushed from behind, to go for a control to get rid of the burden of wearing glasses again.

I went to check with Dr. Horia Stanca, he consulted me, told me that I had a thin cornea because I had been wearing contact lenses for many years but he also gave me good news, namely that he is not so thin to make Femto Lasik impossible, the doctor explained to me exactly what the intervention was, giving me the confidence I needed to schedule my surgery.

It was said, after we had set up all the necessary formalities, I had the prescribed drops and a pair of quality sunglasses so I was ready for the great moment that would change my life. In the morning I arrived at the ophthalmology clinic, made the hospitalization, gave them the documents requested in the original and went to the doctor's office who had consulted me again before surgery, reminded me that I could not make up for 3 weeks, that I have to wear the sunglasses, that I do not have to go into public water for a while, explained to me again what the procedure is, namely that the first time the flap is cut off for 19 seconds and I have to look at a green light and do not scare me when it disappears in the end and then the second procedure follows with the lase that lasts for a few seconds.

I heard my name shouted to go to another room to prepare me for surgery, last time I gave my glasses down, I arrived in the waiting room with a heart like a flea, the ladies there prepared me for the surgery, giving me the boot, the bonnet and the gown, after they equipped me began to administer my anesthetic drops and I had to keep my eyes closed after the administration.

After about 30 minutes, I was seated on the operating table, I was given the last indications that I do not have to move my head, not to speak during surgery, although the doctors were friendly and they tried to relax me at that moment my emotions rolled over, I was afraid I'd better stay with my glasses and I had to accept my fate, so afraid I was following, but I was trying to remember what my doctor told me and it is important to be relaxed.

The lashes were glued to me with a special band, then the device that kept the eye from blinking, they gave me droplets, anesthetics and I saw the device pointed to me, the first time they cut the flap from the right eye with this ultraperforming device, it was very easy to watch the green light and not to scare me when it disappears to the end, just as Mr. doctor said it, lasted for a few seconds without pain, I got courage and on my left eye knowing what to follow I did not have the most people and I relaxed, especially as Mr. the doctor was talking to me and it was imminent that everything was going very well.

I went through the 2nd laser procedure, which lasted 11 seconds for each eye, just as when the flap was cut, I did not feel pain, just a little burning smell, after a few seconds the intervention took end up, dropped me again, applied my therapeutic lenses and lifted me out of the operating table, told me to pay attention to the cables on the floor when I put my foot down from the bed, I opened my eyes

and saw those cables perfectly, I do not think I see that after a few seconds of surgery so clear and that it has lasted for a while.

Nurses led me to the waiting room where I had another 15 minutes with my eyes closed while I opened them from time to time to check my vision, I could read from distance, I was excited as a child, it seemed like I was dreaming.

The 2 days until the next check went normal, without pain or other problems.

At the control I was amazed that I read perfectly even the last row, the doctor consulted with my microscope, removed my therapeutic lenses and sent me that surgery was a success.

For the doctor from a medical point of view it was a success, but for me it was a miracle, almost two weeks after surgery I see perfect, I am very happy, this is the first thought I wake up in the morning when I open my eyes, I realize that I see perfectly, that they no longer depend on eyeglasses.

Just like the surgery, the period after that was very simple, I expected to have pains, to be sensitive to light, but surprisingly, I did not feel a second pain either during surgery or afterwards.

The medical staff behaved impeccably, very kindly, encouraged me for what followed, and the doctor is a genius to me and to many others for whom he did miracles.

I recommend this laser surgery to anyone with sight problems, it is a very simple operation that takes a few minutes, which is not painful and changes the lives of people with sight problems for the better.
